

The two activities are coding and business studies amounting to a grand total of 10 hours a day.

**Option 1:**

In the first option, the time spent on each direction of study is split evenly with 5 hours being devoted to coding, and the same time spent on business studies.

- The first 3 hours of code I devote to web development, and the rest goes for data structures and algorithms
- For business studies, on the other hand, all the time is devoted to study venture capital and presentation practice

**Option 2:**

The second option involves splitting the time between coding and business studies, 6 and 4 hours respectively.

- There are some days that I prefer to focus on a personal coding project rather than on business.

**Option 3:**

Lastly, the third option involves reversing the time spent on each activity changing it to 6 and 4 respectively.

- Business is not all about theoretical knowledge, and the overall structure of a business and its operations, but also about networking. Building good relationships is crucial to launching a successful venture and as such, it takes more time to do that.
